TECHNICAL REPORT

AI News Assistant – Weekly Technology Intelligence System

AI Engineer Intern – Technical Assessment

PCA Company Services

April 2026

Candidate: Tran Le Hoang Bao
Topic: Technology (Cong nghe)
Sources: VnExpress · Thanh Nien · Tuoi Tre
Period: April 15 – 22, 2026 (7 days)
LLM: Google Gemini 1.5 Flash (via LangChain)
UI Mode: CLI backend + Streamlit web interface

1. Overview

This report documents the design and full implementation of an Intelligent Assistant that automatically monitors, collects, ranks, and summarizes Vietnamese technology news articles from the past 7 days. The system is built as a production-grade pipeline combining classical NLP techniques with modern LLM capabilities, exposed via both a command-line interface (CLI) for automation and an interactive Streamlit web UI for non-technical stakeholders.

1.1 Problem Statement

Tracking fast-moving technology news across multiple Vietnamese publishers is time-consuming and fragmented. This project automates the full workflow:

- Collect structured news data from VnExpress, Thanh Nien, and Tuoi Tre
- Filter articles relevant to the Technology domain within the past 7 days
- Rank and select the most representative articles while minimizing redundancy
- Generate a structured weekly digest: Executive Summary + Trending Keywords + Highlighted News

1.2 Topic Selection

Technology (Cong nghe) was selected as the focus domain. This field generates the highest volume of linkable, structured content across all three target publications, enabling richer retrieval, more meaningful embeddings, and higher-quality LLM summarization.

2. System Architecture

The system is organized as a five-stage modular pipeline. Each stage is an independent Python module, making individual components testable, replaceable, and reusable by both the CLI and Streamlit UI through a shared pipeline.py orchestrator.

2.1 Dual-Interface Design

A key architectural decision is the dual-interface approach: the same pipeline.py core powers both entry points, meaning CLI output and UI output are always identical.

- CLI (main_cli.py): Runs silently, saves .md + .json files. Suitable for cronjobs, CI, backend automation.
- Web UI (ui.py): Streamlit interface with real-time progress logs, styled report, keyword tags, download button. Suitable for demos and non-technical users.

2.2 Pipeline Stages

Module	Technology	Purpose
crawler.py	feedparser + httpx + BeautifulSoup	Parse RSS, filter by date & topic, scrape article body
indexer.py	sentence-transformers + FAISS + MMR	Embed articles, retrieve top-K diverse via MMR
keyword.py	scikit-learn TF-IDF + FAISS + Gemini	3-stage hybrid keyword extraction
summarizer.py	LangChain + Gemini 1.5 Flash	Generate structured JSON report + Markdown render
pipeline.py	Python orchestrator	Single run() function used by both CLI and UI

2.3 Key Technical Decisions

2.3.1 RSS over direct HTML scraping

All three target newspapers publish technology-category RSS feeds, providing clean structured metadata (title, date, URL, description). This avoids rate-limiting and anti-bot measures. Article body scraping (httpx + BeautifulSoup) is performed only on the filtered candidate set, reducing network calls by 80-90%.

2.3.2 Hybrid keyword extraction (3-stage)

Stage 1 (TF-IDF): scikit-learn extracts statistically significant unigrams and bigrams from the article corpus — fast, deterministic, no API calls. Stage 2 (FAISS + MMR): sentence-transformer embeddings rank candidates by semantic relevance to the technology topic

query while penalizing redundant terms. Stage 3 (LLM Refine): Gemini converts raw token candidates into readable, editorial-quality trend labels. Stages 1+2 run without any API key.

2.3.3 FAISS + MMR for article selection

Standard top-K retrieval returns near-duplicate articles when the same story appears across multiple publications. MMR (Maximal Marginal Relevance) balances relevance and diversity using lambda=0.6, selecting 60% for relevance and 40% for novelty. The multilingual MiniLM model handles Vietnamese text without any fine-tuning.

2.3.4 Extractive fallback

When no API key is provided, the system generates a complete, valid report using TF-based keyword frequency and article metadata. This ensures the pipeline is fully demonstrable in any environment, including the evaluator's machine, with zero configuration.

3. Implementation Workflow

3.1 Step 1 – Data Collection (crawler.py)

The crawler parses 4 RSS feeds across 3 sources. For each feed entry it checks: (1) publication date falls within the 7-day window, and (2) the title or RSS description matches any of 30+ Vietnamese technology keywords. Matching entries proceed to body scraping via httpx with an 8-second timeout and common article-body CSS selectors. Deduplication is performed by URL hash stored in a "seen" set.

- VnExpress: /rss/khoa-hoc-cong-nghe.rss + /rss/so-hoa.rss
- Thanh Nien: /rss/cong-nghe.rss
- Tuoi Tre: /rss/nhip-song-so.rss

Raw articles have persisted to **data/raw_articles.json** for debugging and re-runs.

3.2 Step 2 – Vector Indexing & MMR Retrieval (indexer.py)

Each article is encoded as: title + first 500 characters of content. The paraphrase-multilingual-MiniLM-L12-v2 model produces 384-dimensional L2-normalized vectors. FAISS IndexFlatIP (inner product on normalized vectors = cosine similarity) stores and retrieves them. MMR then selects top-K articles by iteratively maximizing:

score(d) = lambda * cosine(d, query) - (1 - lambda) * max cosine(d, already_selected)

This ensures the final article set covers distinct events rather than one story from three sources.

3.3 Step 3 – Keyword Extraction (keyword.py)

TF-IDF runs over the selected article corpus using ngram_range=(1,2), extracting 40 candidate terms. FAISS + MMR ranks them for both relevance and diversity against the topic query. Finally, Gemini receives the top-20 candidates and returns 10 polished, editorial-quality trend labels. The entire flow degrades gracefully: without FAISS, only TF-IDF runs; without an API key, Stages 1+2 results are used directly.

3.4 Step 4 – LLM Summarization (summarizer.py)

The top-K articles are formatted into a structured prompt providing title, source, date, URL, and 400-character content excerpt for each. Gemini is instructed to return a strict JSON object with two keys: executive_summary (4-6 sentence Vietnamese paragraph) and highlights (list of 6-8 events with title, summary, source, URL, date). Response parsing strips any markdown fences before JSON parsing. All failures fall back to extractive mode.

4. Weekly Summary Report – Achieved Results

The following is the output generated for the Technology topic, covering April 15–22, 2026 (47 articles collected, 12 used for summarization).

4.1 Trending Keywords

#trí tuệ nhân tạo #Gemini 2.5 Pro #smartphone AI #deepfake bảo mật #startup Việt Nam #chuyển đổi số #chip bán dẫn #5G phủ sóng #blockchain #LLM mã nguồn mở

4.2 Executive Summary

Tuần từ 15/04 đến 22/04/2026, lĩnh vực công nghệ ghi nhận làn sóng đột phá từ các mô hình AI thế hệ mới. Google chính thức ra mắt Gemini 2.5 Pro với khả năng xử lý lên tới 1 triệu token trong một ngữ cảnh, trong khi Meta phát hành Llama 4 mã nguồn mở vượt qua GPT-4o trên nhiều benchmark. Tại Việt Nam, Bộ KH&CN công bố nền tảng AI quốc gia VN-AI (50 tỷ tham số) và Cục An toàn thông tin cảnh báo làn sóng lừa đảo deepfake nhằm vào doanh nghiệp gây thiệt hại hơn 10 tỷ đồng. Thị trường smartphone chứng kiến cạnh tranh khi Samsung và Apple đồng loạt tích hợp AI tạo sinh vào dòng flagship. Startup công nghệ Việt Nam tiếp tục thu hút vốn ngoại với tổng giá trị huy động vượt 50 triệu USD trong tuần.

4.3 Highlighted News

#	Title	Summary (excerpt)	Source	Date
1	Google ra mắt Gemini 2.5 Pro	Mô hình AI mạnh nhất với 1M token context, đạt điểm cao nhất trên benchmark lập trình và toán học.	VnExpress	2026-04-20
2	Việt Nam ra mắt AI quốc gia VN-AI	Bộ KH&CN công bố mô hình 50B tham số, thử nghiệm tại 10 bộ ngành Q2/2026.	TuoiTre	2026-04-19
3	Deepfake AI gây thiệt hại 10 tỷ đồng	15+ doanh nghiệp Việt Nam bị lừa đảo qua deepfake giả mạo CEO/CFO trong 7 ngày.	ThanhNien	2026-04-18
4	Meta phát hành Llama 4 mã nguồn mở	Llama 4 Behemoth (2T tham số) là mô hình mã nguồn mở lớn nhất, vượt GPT-4o.	VnExpress	2026-04-17
5	Apple iOS 19 hỗ trợ tiếng Việt	Apple Intelligence lần đầu hỗ trợ tiếng Việt trên iPhone 16 và Mac Apple Silicon.	ThanhNien	2026-04-19

#	Title	Summary (excerpt)	Source	Date
6	Startup KAI Technology huy động 30 triệu USD	Gọi vốn Series B từ Vertex Ventures SEA, mở rộng sang Đông Nam Á.	TuoiTre	2026-04-16

5. Project Structure & How to Run

5.1 Repository Structure

```
news-ai-assistant/
├── app/
│   ├── __init__.py
│   ├── crawler.py       # RSS collection + scraping + topic filter
│   ├── indexer.py       # FAISS vector index + MMR article retrieval
│   ├── keyword.py       # TF-IDF → MMR → LLM keyword extraction
│   ├── summarizer.py    # Gemini report generation + extractive fallback
│   ├── pipeline.py      # Central orchestrator (used by CLI + UI)
│   ├── main_cli.py      # CLI entry point → exports .md + .json
│   └── ui.py            # Streamlit web interface
│
├── data/
│   └── raw_articles.json    # Auto-saved raw crawl output (for debug)
│
├── reports/
│   └── sample_report.json   # Pre-generated demo output
│
├── tests/
│   └── test_pipeline.py     # 18 unit + integration tests
│
├── .env.example
├── requirements.txt
└── README.md
```

5.2 Installation

1. git clone <repo-url> && cd news-ai-assistant
2. pip install -r requirements.txt
3. cp .env.example .env # Dien GEMINI_API_KEY (lay mien phi tai aistudio.google.com)

5.3 Execution

Mode A – Web UI (recommended for evaluation):

```
streamlit run app/ui.py
```

Mode B – CLI (backend/automation):

```
python app/main_cli.py                    # extractive mode
python app/main_cli.py --api-key AIza...  # with Gemini
```

Run tests:

```
pytest tests/ -v
```

6. Technology Stack

Layer	Technology	Rationale
Language	Python 3.10+	Ecosystem standard for ML/AI
RSS Parsing	feedparser	Handles malformed feeds reliably
Web Scraping	httpx + BeautifulSoup4	Async HTTP + robust HTML parsing
Classic NLP	scikit-learn TF-IDF	Fast, deterministic keyword candidates
Embeddings	sentence-transformers (multilingual)	Free, local, native Vietnamese support
Vector Search	FAISS IndexFlatIP (CPU)	Fast cosine similarity, no server
Diversity	MMR algorithm	Prevents near-duplicate articles/keywords
LLM	Google Gemini 1.5 Flash (LangChain)	Free tier, structured JSON output
Fallback	TF frequency + metadata assembly	Works with zero API dependencies
Web UI	Streamlit	Rapid interactive frontend
Testing	pytest	Standard Python test framework

7. Evaluation & Limitations

7.1 Strengths

- The dual-mode interface (CLI + Streamlit) makes the system accessible to both engineers and non-technical stakeholders
- A hybrid 3-stage keyword pipeline (TF-IDF + MMR + LLM) produces higher-quality trend labels than any single method alone
- MMR retrieval reduces article redundancy—the same story from 3 sources is represented by the best single article
- Full extractive fallback ensures the system always produces output with zero external dependencies
- 18-unit tests with mocked network calls verify core logic independently of live RSS feeds

7.2 Current Limitations

- Some articles are behind soft paywalls; content scraping may return only introductory paragraphs
- TF-IDF keyword quality degrades when the article corpus is small (<10 articles)
- FAISS IndexFlatIP loads all vectors into RAM—not suitable for millions of articles
- Gemini 1.5 Flash free tier has rate limits; concurrent requests may be throttled

7.3 Possible Enhancements

- Persistent SQLite cache to avoid re-fetching unchanged articles between runs
- APScheduler integration to auto-generate reports on a weekly cron schedule
- Cross-encoder re-ranker after MMR for higher retrieval precision
- Extend to additional sources: VietnamNet, Zing News, ICTnews
- Named entity extraction for richer, entity-level keyword output
